

A web page which can help you with this assignment will be linked to the course webpage. You are encouraged to discuss this assignment with other students and with the instructors, but the work you hand in should be your own.

A web page will be posted listing individualized data for each student. For this lab, the data will consist of coordinates for three points, p , q , and r , in \mathbb{R}^3 . Then \vec{pq} will denote the vector directed *from* p *to* q and \vec{pr} will denote the vector directed *from* p *to* r . The vector \vec{v} will be $\vec{pq} \times \vec{pr}$, the cross product (vector product) of the two vectors. T will be the triangle in \mathbb{R}^3 whose vertices are p , q , and r .

Use **Maple** to compute \vec{pq} , \vec{pr} , and \vec{v} . Use **Maple** to sketch these three vectors and the triangle T in one picture.

This assignment is due **September 26th**. Late submissions will *not* be accepted.

Please hand in the following material:

0. All pages should be labeled with your name and section number. Also, please *staple* together all the pages you hand in.
1. A printout of the **Maple** worksheet showing all commands used. Please clean this up by including only those commands which did not have errors.
2. Identify clearly in your printout the components of the vectors \vec{pq} , \vec{pr} , and \vec{v} . (These identifications can be written by hand on your printout.)
3. Hand in a printout of a picture of the three vectors and the triangle T . The picture should include labeled axes and should show the geometry of the situation well. Label the points p , q , and r in your picture. Label the vector v in your picture. Label the triangle T in your picture. (These labels can be written by hand on your printout.)
