1.4.9

Show that the matrices  $\begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}$ ,  $\begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ ,  $\begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix}$ , and  $\begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}$  generate  $M_{2 \times 2}(F)$ .

Proof:

Let  $A = \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} \in M_{2 \times 2}(F)$ .

Then  $A = a_{11} \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} + a_{12} \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix} + a_{21} \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix} + a_{22} \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}$ . ■

1.4.13

Show that if  $S_1$  and  $S_2$  are subsets of a vector space  $V$  such that  $S_1 \subseteq S_2$ , then  $\text{span}(S_1) \subseteq \text{span}(S_2)$ . In particular, if  $S_1 \subseteq S_2$  and  $\text{span}(S_1) = V$ , deduce that  $\text{span}(S_2) = V$ .

Proof:

Let  $S_1$  and  $S_2$  be subsets of a vector space  $V$  such that  $S_1 \subseteq S_2$ . Let  $u \in \text{span}(S_1)$ . Then, for some finite number of vectors  $x_1, x_2, \dots, x_n$  in  $S_1$  and scalars  $a_1, a_2, \dots, a_n$ , we have

$$u = a_1x_1 + a_2x_2 + \dots + a_nx_n.$$

But since  $S_1 \subseteq S_2$ , we have  $x_1, x_2, \dots, x_n$  in  $S_2$ , so  $u$  is a linear combination of vectors in  $S_2$ . Thus  $u \in \text{span}(S_2)$ .

Now assume  $\text{span}(S_1) = V$ . Then, by Theorem 1.5,  $\text{span}(S_2) \subseteq V$  and, by assumption,  $V \subseteq \text{span}(S_1) \subseteq \text{span}(S_2)$ . ■

## 1.5.5

Show that the set  $\{1, x, x^2, \dots, x^n\}$  is linearly independent in  $P_n(F)$ .

Proof:

We examine the solutions to the equation  $a_0 1 + a_1 x + a_2 x^2 + \dots + a_n x^n = 0$ . Since this equality must hold for all  $x \in \mathbb{R}$ , it must hold for  $x = 0$ , so  $a_0 1 + a_1 0 + a_2 0 + \dots + a_n 0 = a_0 = 0$ . Thus  $a_0 = 0$ . Taking derivatives,  $a_1 + 2a_2 x + 3a_3 x^2 + \dots + na_n x^{n-1} = 0$ . As before, when  $x = 0$ , we have  $a_1 + 2a_2 0 + 3a_3 0 + \dots + na_n 0 = a_1 = 0$ . Thus  $a_1 = 0$ . Repeating this process, we obtain

$$a_0 = a_1 = a_2 = \dots = a_n = 0.$$

Thus the only solution is the trivial solution and the set is linearly independent. ■

## 1.5.9

Let  $u$  and  $v$  be distinct vectors in a vector space  $V$ . Show that  $\{u, v\}$  is linearly dependent if and only if  $u$  or  $v$  is a multiple of the other.

Proof:

(i) Assume  $\{u, v\}$  is linearly dependent. Then, for some scalars  $a, b$  not both zero, we have

$au + bv = 0$ . If  $a \neq 0$ , then  $u = \frac{-b}{a}v$ , so  $u$  is a multiple of  $v$ . If  $b \neq 0$ , then  $v = \frac{-a}{b}u$ , so  $v$  is a multiple of  $u$ .

(ii) Suppose  $u$  is a multiple of  $v$ . Then, for some scalar  $c$ ,  $u = cv$ . Thus  $1u + (-c)v = 0$ . Since 1 is nonzero,  $\{u, v\}$  is linearly dependent. Now suppose  $v$  is a multiple of  $u$ . Then, for some scalar  $d$ ,  $v = du$ . Thus  $(-d)u + 1v = 0$ . Since 1 is nonzero,  $\{u, v\}$  is linearly dependent. ■

## 1.5.14

Prove that a set  $S$  is linearly dependent if and only if  $S = \{0\}$  or there exist distinct vectors  $v, u_1, u_2, \dots, u_n$  in  $S$  such that  $v$  is a linear combination of  $u_1, u_2, \dots, u_n$ .

Proof:

(i) Assume  $S$  is linearly dependent. Then, for some finite number of distinct vectors  $u_1, u_2, \dots, u_n$  in  $S$  and scalars  $a_1, a_2, \dots, a_n$  not all zero,

$$a_1 u_1 + a_2 u_2 + \dots + a_n u_n = 0.$$

If  $n = 1$ , then  $a_1 u_1 = 0$  and  $a_1 \neq 0$ , so  $u_1 = 0$  and thus  $S = \{0\}$ . If  $n > 1$ , then, since  $a_1, a_2, \dots, a_n$  are not all zero, for some  $i = 1, 2, \dots, n$ ,  $a_i \neq 0$ . Hence we have

$$u_i = \frac{-a_1}{a_i} u_1 + \frac{-a_2}{a_i} u_2 + \dots + \frac{-a_{i-1}}{a_i} u_{i-1} + \frac{-a_{i+1}}{a_i} u_{i+1} + \dots + \frac{-a_n}{a_i} u_n.$$

(ii) In the case that  $S = \{0\}$ ,  $S$  is linearly dependent because  $1 \cdot 0 = 0$ . In the case  $S \neq \{0\}$ , we assume that there exist distinct vectors  $v, u_1, u_2, \dots, u_n$  in  $S$  such that  $v$  is a linear combination of  $u_1, u_2, \dots, u_n$ . Hence, for some scalars  $a_1, a_2, \dots, a_n$ ,

$$v = a_1 u_1 + a_2 u_2 + \dots + a_n u_n.$$

Adding  $(-1)v$  to both sides gives

$$(-1)v + a_1 u_1 + a_2 u_2 + \dots + a_n u_n = 0.$$

Since not all of the coefficients are zero,  $S$  is linearly dependent. ■
