## 3.2.17

Prove that if  $B$  is a  $3 \times 1$  matrix and  $C$  is a  $1 \times 3$  matrix, then the  $3 \times 3$  matrix  $BC$  has rank at most 1. Conversely, show that if  $A$  is any  $3 \times 3$  matrix having rank 1, then there exist a  $3 \times 1$  matrix  $B$  and a  $1 \times 3$  matrix  $C$  such that  $A = BC$ .

Proof:

- (i) Let  $B$  be a  $3 \times 1$  matrix and  $C$  be a  $1 \times 3$  matrix. Then clearly the dimension of the subspace generated by the columns of  $B$  is at most 1 and thus  $\text{rank}(B) \leq 1$ . But, by Theorem 3.7,  $\text{rank}(BC) \leq \text{rank}(B)$ . Hence  $\text{rank}(BC) \leq 1$ .
- (ii) Let  $A$  be a  $3 \times 3$  matrix having rank 1. Then the dimension of the subspace generated by the columns of  $A$  is 1. Let  $\beta = \{B\}$  be a basis for this subspace, where  $B$  is a  $3 \times 1$  matrix. Then there exist unique scalars  $x_1, x_2,$  and  $x_3$  such that  $\text{col}_1(A) = x_1B$ ,  $\text{col}_2(A) = x_2B$ , and  $\text{col}_3(A) = x_3B$ . Let  $C = (x_1 \ x_2 \ x_3)$  be a  $1 \times 3$  matrix. Then

$$BC = B(x_1 \ x_2 \ x_3) = (x_1B \ x_2B \ x_3B) = (\text{col}_1(A) \ \text{col}_2(A) \ \text{col}_3(A)) = A \quad \blacksquare$$

## 3.2.21

Let  $A$  be an  $m \times n$  matrix with rank  $m$ . Prove that there exists an  $n \times m$  matrix  $B$  such that  $AB = I_m$ .

Proof:

Let  $A$  be an  $m \times n$  matrix with rank  $m$ . Then the dimension of the subspace  $S$  generated by the columns of  $A$  is  $m$ . But  $S$  is a subspace of  $F^m$ , which also has dimension  $m$ . Thus  $S = F^m$ . Since clearly  $n \geq m$  and the columns of  $A$  generate  $F^m$ , we can reduce the set of columns of  $A$  to a basis for  $F^m$ .

Let  $r_1, r_2, \dots, r_m \in \{1, 2, \dots, n\}$  such that  $r_1 < r_2 < \dots < r_m$ , and let  $\beta = \{\text{col}_{r_1}(A), \text{col}_{r_2}(A), \dots, \text{col}_{r_m}(A)\}$  be a basis for  $F^m$  constructed by reducing the set of columns of  $A$ . For reference, let  $\Gamma = \{1, 2, \dots, m\}$  and  $\Delta = \{1, 2, \dots, n\} - \{r_1, r_2, \dots, r_m\}$ . Let  $C$  be the  $m \times m$  matrix such that, for all  $k \in \Gamma$ ,  $\text{col}_k(C) = \text{col}_{r_k}(A)$ . We see that  $\text{rank}(C) = m$  and thus  $C$  is invertible. Now let  $B$  be the  $n \times m$  matrix such that, for all  $k \in \Gamma$ ,  $\text{row}_{r_k}(B) = \text{row}_k(C^{-1})$ , and, for all  $k \in \Delta$ ,  $\text{row}_k(B) = 0$ .

We now show that  $AB = I_m$ . Let  $i, j \in \Gamma$ . Then

$$\begin{aligned} (AB)_{ij} &= \sum_{k=1}^m A_{ik} B_{kj} = \sum_{k \in \Gamma} A_{ir_k} B_{r_k j} + \sum_{k \in \Delta} A_{ik} B_{kj} = \sum_{k \in \Gamma} C_{ik} C_{kj}^{-1} + \sum_{k \in \Delta} A_{ik} 0 = (CC^{-1})_{ij} + 0 \\ &= (I_m)_{ij} \end{aligned}$$

Thus  $AB = I_m$ . ■
